

ISB-Leadership with AI

Module 11 – Implementing AI in Organisations

Implementation Framework - Strategy

Aligning AI with Company Goals

Aligning AI to Strategy and Business Goals: Checklist

Understand business goals deeply and focus solely on them

Establish KPIs measuring relevant business outcomes

Invest in talent and training

Identify use cases through comprehensive assessment

Ensure data quality, safety and compliance

Embrace ethical and responsible AI

Set up cross-functional teams with appropriate representation

Prototype and iterate

Measure and communicate impact

Understanding Explainable AI

Explainable AI clarifies decisions and actions

Transparency

Aims to make AI decision-making transparent

Understanding

Enables users to understand how conclusions are reached

Trust

Fosters trust and accountability in AI systems

Benefits of Explainable AI

Provides insights into the AI process

Crucial for decision-making in industries

Builds trust, leading to greater adoption

Supports regulatory compliance

Explainable AI: Challenges

Implementing AI with McKinsey's Framework

Case Study: Apollo and Its Journey of Digital Transformation

Apollo's Strategic Shift: Efficiency, Data and Patient Focus

Efficiency goals
Aimed to improve
efficiency and cut
costs

Data-driven approach
Focused on
data-informed
decision-making

Patient-centered care
Shifted focus from the
institution to the patient

New mindset
Adopted a fresh
approach to
problem-solving

Desired Outcomes

Service efficiency

Patient experience

Brand strength for higher willingness to pay

Consultant experience

Clinical excellence

Key Components of Apollo's Transformation Program

Operating model overhaul

Revamping organisational structure, roles and skills

Leadership transformation

Focusing on enhancing leadership capabilities

Improved information flows

Streamlining communication across hospital departments

CCDIV Framework for Digital Transformation

Application of CCDIV Framework at Apollo Hospitals

Domains	Themes	Key concepts	Apollo initiatives
Customers are a dynamic network	Harness customer networks	Rethink marketing funnel and the path to purchase: omnichannel	• Ask Apollo / Apollo 247 • Registration kiosks • Warm Welcome
Competition is across fluid boundaries	Build platforms and not just products	• Platform business models • Digital disintermediation	• Dial30 • Portzo • MedMantra • Discharge summary (insurance claims)
Data is being continually generated	Turn data into assets	• Data driven decision making • Drivers of big data	• Apollo standards of clinical care • Consultant DSS

Application of CCDIV Framework at Apollo Hospitals

Domains	Themes	Key concepts	Apollo initiatives
Innovation is based on testing and validating	Innovate through rapid experimentation	• Divergent and convergent experimentation • Minimum viable product	• Instant feedback • Post OP feedback • 72 hours feedback • Smart replication
Value proposition defined by changing customer needs	Adapt continually	Paths out of a declining market	• MedMantra • Kitting Procedure

Patient Journey

Enhancing Brand and Consultant Experience

Oscar Polo and Apollo 24/7

- Differentiated and enhanced brand
- Improved consultant experience

Consultant DSS initiative

- Enhanced physician-hospital interactions
- Streamlined discharge process

Faster discharge summaries

- Quick check-out vs competitors
- Boosted patient experience and brand

Implementation Framework – Organisation

The Centralised Model

Organisation

- Central body manages analytics and insights
- Corporate governs result analysis, reporting and data quality

Attributes

- Explains why did it happen
- Uses complex data examination techniques like data discovery and correlation

Drivers

- What will happen?
- Uses statistical methods and forecasting techniques to predict future trends

The Distributed Model

Organisation

- Autonomous analytics managed locally by regions, branches or functions
- Distributed business reporting and analytics teams

Attributes

- Analysts closely integrated with business
- Multiple processes and databases

Drivers

- Fits complex structures with diverse products or M&As
- Requires mature analytics for business growth

The Centre of Excellence Model

Organisation

- Analytic processes are centrally owned with support provided to the local units

Attributes

- Businesses handle performance measurement and reporting
- COE oversees governance, recruiting and career management

Drivers

- Ideal for businesses with moderately complex business structure
- Has a mature reporting and analytics capabilities
- Data has a competitive advantage

Hybrid Models: Practice vs Hub & Spoke

Community or Practice Model

- Independent teams collaborate and share knowledge
- Supports continuous learning

Hub and Spoke Model

- Similar work at HQ and units with different scopes
- Balances centralised strategy with local execution

Setting Up an Analytics Operating Model: Example

Analytics hub (Headquarters)

- Develops strategy and governance
- Houses data scientists for model building
- Provides analytics services for complex projects

Business unit analytics

- Capable of interpreting data and generating insights
- Less sophisticated compared to the analytics capability at the headquarters

Operating Model Spectrum

● Basic Reporting ● Intermediate Analytics ● Advanced Analytics ● Tools / Processes / Governance ● Analytical Data

Developing and Managing an AI- Skilled Workforce

Data and AI Literacy

Technical expertise

Building, running and interpreting AI models

Proficiency in AI algorithms (e.g., machine learning, deep learning, NLP)

Mastery of programming languages (e.g., Python, Java)

Familiarity with AI frameworks (e.g., TensorFlow, PyTorch)

Advanced data processing, analysis, and visualisation skills

Expertise in deploying AI models and handling data for model building

Data and AI Literacy

Domain expertise

Test and iterate models
with both production
and test data

Understand the
business problem and
desired outcomes

Aligning AI
strategy with
business strategy

Comprehend AI
capabilities and limitations
and align projects with
business goals

Data and AI Literacy Competencies

Consulting expertise

Collaborate between data scientists, engineers, domain experts and stakeholders

Align AI initiatives with strategic business goals

Encourage a data-driven culture across departments

Foster AI adoption, communication and teamwork

Integrate AI capabilities with existing business processes and workflows

Analytics Team Skills

Key Roles in AI Projects

Chief AI Officer, data scientists/ Engineers

- Clean, analyse and interpret data
- Build and maintain data infrastructure

Domain experts

Guide data selection, model development and interpret results

Project managers

Keep the project on track

Change management specialist

Develop and implement employee buy-in strategies

Business analysts

Translate business goals into actionable plans

Strategies for AI Workforce Development

Google's Approach to Employee Training

Accessible courses for all backgrounds, including non-technical

Hands-on coding exercises using TensorFlow

Covers key topics like supervised learning and neural networks

Role-based internal training for specific job roles

Tools provided: DataComp, Tableau, Power BI, and IBM Data Science

Free access to courses

Google's Training Process

Leadership and AI Advocacy

Role of Leadership in AI Adoption

Leaders in the AI age have the responsibility to:

Champion AI adoption

Foster an AI-ready workforce

Ensure responsible AI development and deployment

Articulate AI benefits and foster innovation

AI's Exponential Shift

Impact of AI

Organisations

- AI drives innovation and business value
- Leaders face challenges in scaling AI beyond POCs and pilots.
- Governments are concerned about AI's unintended consequences
- Regulations are emerging due to obsolescence risks.

Individuals

- Use AI without fully understanding it
- Lack the understanding of how AI uses their data
- Privacy implications of data sourcing remain unclear

It is crucial to identify the responsible leaders and their key decision points.

Key Considerations for AI Leadership

Leaders are:

Determining responsibility for AI implementation

Appointing AI risk officers or integrating with existing roles (CTO, general counsel).

Creating a culture of responsible AI use and data handling.

Deciding between buying tech talent or building it internally.

AI Dilemmas for Leaders

Job Impact

- Will AI replace jobs or change their nature?
- How will humans and machines collaborate in the future?
- What will future teams and workplaces look like?

Reducing systemic bias

- Addressing and mitigating systemic biases in AI to prevent human biases from affecting data and predictions.

Balancing privacy and experience

- Balancing the enhancement of online experiences with the protection of individual privacy.

AI Dilemmas for Leaders

AI and cybercrime

- AI can help solve cyber crimes.
- AI also increases vulnerability to cyber crimes.

Social impact of AI

- Social media platforms Can be used to create social divisions.
- AI has the capability of creating much greater cohesion.
